Control boards that require firmware update

② M4 Control Board

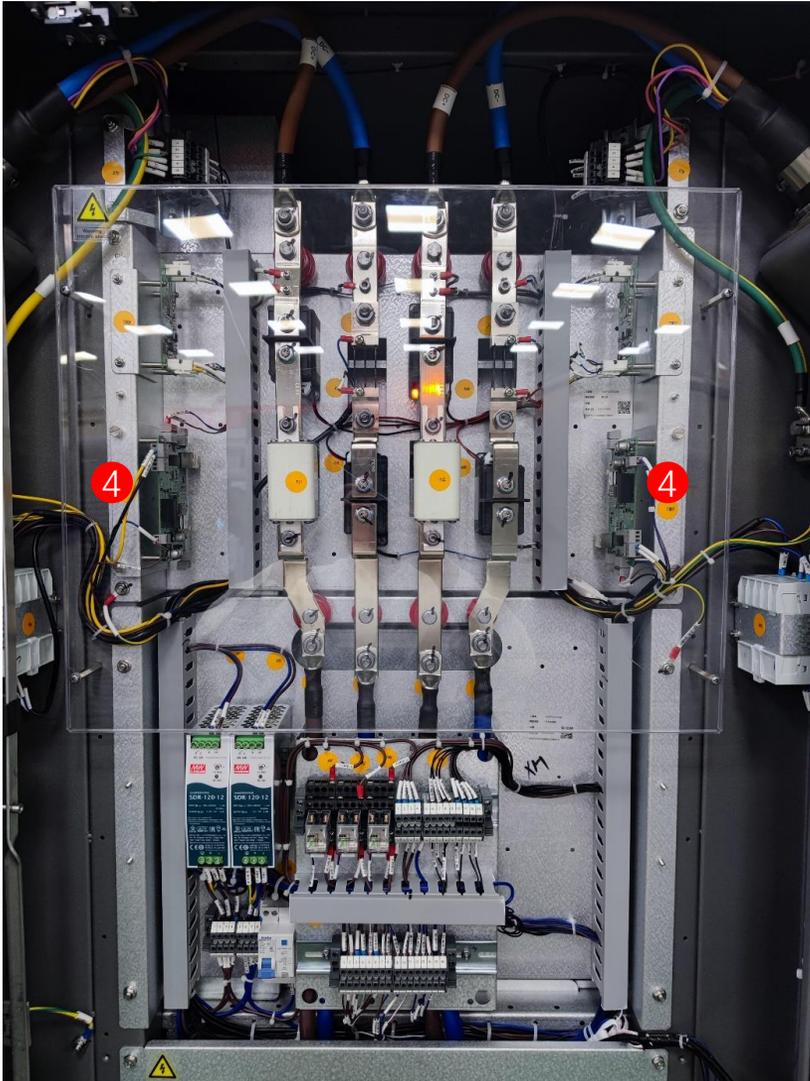

① A7 Main Board

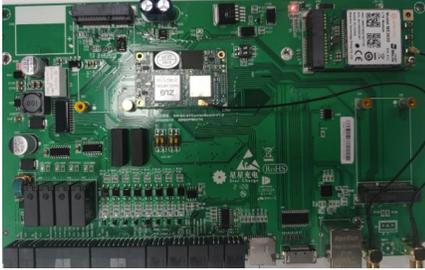

③ PDU Control Board

Control boards that require firmware update

④ SECC Board

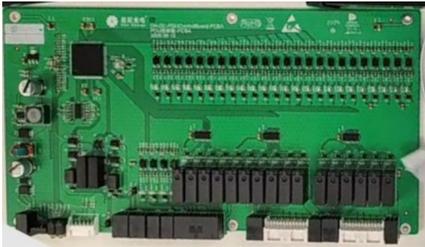

Control boards that require firmware update

- 1 A7 Main Board: backend communication, configuration, display UI & diagnostic log

- 2 M4 Control Board: output voltage and current control

- 3 PDU Control Board: power module distribution control

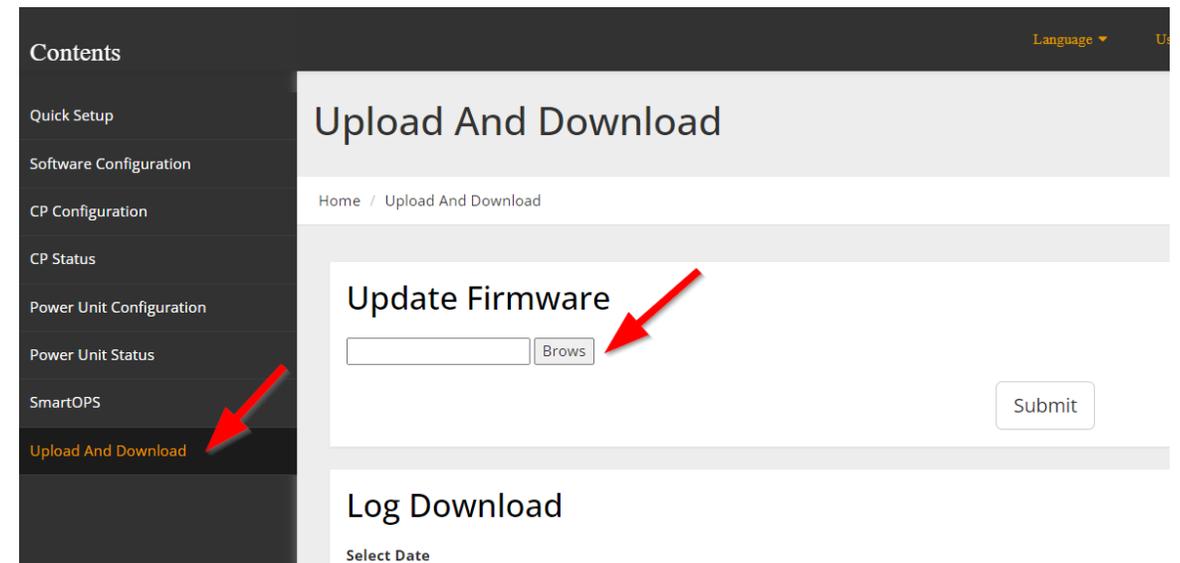

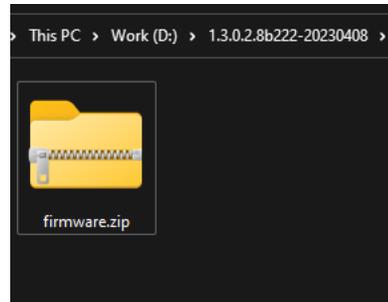

- 4 SECC Board: communication between EV and charger

Update methods

Method 1: Upload firmware.zip

- This is the regular and easiest method to update firmware.
- Use Ethernet cable to connect charger and laptop → open configuration web panel → go to upload page → select firmware zip file and upload → Update finish
- This can update A7 mainboard, M4 control board and SECC board.
- The firmware.zip can be also remotely updated via OCPP backend.

Update methods

Method 2: Use dedicated tool to directly flash each board separately

- In some situations (complex troubleshooting, system software crashes, big software structure changes), using regular method is not possible to update firmware.
- A7 main board: use SD card
- M4 control board: use J-Link
- PDU control board: use J-Link
- SECC board: use SD card

J-Link
